PREFACE

This is the thirteenth time when the conference “Dynamical Systems: Theory and Applications” gathers a numerous group of outstanding scientists and engineers, who deal with widely understood problems of dynamics met in daily life.

Organization of the conference would not have been possible without a great effort of the staff of the Department of Automation, Biomechanics and Mechatronics, as well as Committee of Mechanics of the Polish Academy of Sciences. The financial support has been given by the Polish Academy of Sciences.

It is a great pleasure that our invitation has been accepted by recording in the history of our conference number of people, including good colleagues and friends as well as a large group of researchers and scientists, who decided to participate in the conference for the first time. With proud and satisfaction we welcomed over \textbf{180} persons from \textbf{29} countries all over the world. They decided to share the results of their research and many years experiences in a discipline of dynamical systems by submitting many very interesting papers.

This year, the DSTA Conference Proceedings were split into three volumes entitled “Dynamical Systems” with respective subtitles: \textit{Mathematical and numerical approaches; Mechatronics and life sciences} and vol. \textit{3 Control and stability}. Additionally there will be also published two volumes of Springer Proceedings in Mathematics and Statistics entitled “\textit{Dynamical Systems. Modelling}” and “\textit{Dynamical Systems. Theoretical and Experimental Analysis}”.

These books include the invited papers and regular papers dealing with the following topics:

- control in dynamical systems,
- stability of dynamical systems,
- asymptotic methods in nonlinear dynamics,
- mathematical approaches to dynamical systems,
- dynamics in life sciences and bioengineering,
- engineering systems and differential equations,
- original numerical methods of vibration analysis,
- bifurcations and chaos in dynamical systems,
- vibrations of lumped and continuous systems,
- non-smooth systems,
- other problems.

Proceedings of the 13th Conference „Dynamical Systems - Theory and Applications“ summarize \textbf{164} and the Springer Proceedings summarize \textbf{60} best papers of university teachers and students, researchers and engineers from whole the world. The papers were chosen by the International Scientific Committee from \textbf{315} papers submitted to the conference. The reader thus obtains an overview of the recent developments of dynamical systems and can study the most progressive tendencies in this field of science.
Our previous experience shows that an extensive thematic scope comprising dynamical systems stimulates a wide exchange of opinions among researchers dealing with different branches of dynamics. We think that vivid discussions will influence positively the creativity and will result in effective solutions of many problems of dynamical systems in mechanics and physics, both in terms of theory and applications.

We do hope that DSTA 2015 will contribute to the same extent as all the previous conferences to establishing new and tightening the already existing relations and scientific and technological co-operation between both Polish and foreign institutions.

On behalf of both
Scientific and Organizing Committees

Chairman
Professor Jan Awrejcewicz
CONTENTS

Igor V. Andrianov, Jan Awrejcewicz, Bernd Markert, Galina A. Starushenko
On the vibrations of a composite structure with hexagonal structure of a circular inclusions ................................................................. 11

Jan Awrejcewicz, Paweł Olejnik
Identification of a nonlinear damping coefficient characteristics in the free decay test of a single pendulum with friction .................................................. 23

Henryk Bąkowski
An explanation of water acting on rails wear using finite elements method .......................................................................................... 37

Laszlo Bencsik, Ambrus Zelei
A study on the effect of human running cadence based on the bouncing ball modell ............................................................................... 47

Yves Bergeon, Vaclav Krivanek, Jean Motsch, Alexandr Stefek
Optimization of accuracy on a low-cost 3D mapping system for indoor navigation .................................................................................. 57

Paweł Biesiacki, Jerzy Mrozowski, Jan Awrejcewicz
Study of dynamic forces in human upper limb in forward fall ......................... 65

Andrzej Buchacz, Andrzej Baier, Krzysztof Herbuś, Michał Majzner, Piotr Ociepka
Investigations of motion of a freight wagon aimed to identify the forces acting on the side wall of the wagon ................................................. 77

Andrzej Buchacz, Damian Gałęziowski
Negative elements optimization and realization in synthesis of discrete mechatronic systems ......................................................................... 89

Vytautas Bučinskas, Andrius Dzedzickis, Nikolaj Šešok, Ernestas Šutinys, Igor Iljin, Artur Kazickij
Two-axis mechanical vibration harvester .......................................................... 99

Radek Bulín, Michal Hajžman, Pavel Polach
Analysis of vibrations of a cable-pulley system using the absolute nodal coordinate formulation ............................................................. 111

Andrzej Burghardt, Dariusz Szybicki, Piotr Gierlak, Krzysztof Kurc, Magdalena Muszyńska
Robotic automation of the turbo-propeller engine blade grinding process .......... 121

Anatoli Chigarev, Victor Polenov, Pavel Shirvel
Nonlinear dynamics of waves in inhomogeneous media with fractal structures ......................................................................................... 131
Mariella Diaferio
On the dynamic response of suspended footbridges ........................................... 143

Fadi Dohnal, Athanasios Chasalevris
Inducing modal interaction during run-up of a magnetically supported rotor ......................................................................................................................... 151

Peter Frankovský, František Trebuňa, Darina Hroncová, Alexander Gmiterko, Ján Kostka
Modelling of mechatronic systems using bond graphs ........................................ 163

Paweł Fritzkowski, Krzysztof Magnucki, Szymon Milecki
Nonlinear transverse vibrations of a beam under an axial load .......................... 175

Jakub Gajek, Radosław Kępinski, Jan Awrejcewicz
Mathematical model of a multi-parameter oscillator based on a core-less three-phase linear motor with skewed coils .................................................. 185

Dariusz Grzelczyk, Bartosz Stańczyk, Jan Awrejcewicz
Power consumption analysis of different hexapod robot gaits ............................. 197

Thomas H Hanley, Barry Gallacher, Harry Grigg
Towards the exploitation of local resonances for novel MEMS devices ............. 207

Andjelka Hedrih, Katica Hedrih (Stevanovic)
Deformation work of Zona Pelucida in process of fertilization ............................. 217

Anna Jaskot, Bogdan Posiadała, Szczepan Śpiewak
Dynamics model of the four-wheeled mobile platform ........................................ 227

Jacek Jaworski, Olga Szlachetka
Free vibration of cantilever beams of various cross-section ............................... 237

Stefan Kaczmarczyk
The dynamics of vertical transportation systems: from deep mine operations to the modern high-rise applications ................................................................. 249

Radosław Kępinski, Jan Awrejcewicz, Jakub Gajek
Analysis of stepper motor dynamics using numerical methods .......................... 261

Natalya Kizilova
Nonlinear inverted pendulum model with time delay control for postural sway in humans ........................................................................................................ 273

Shuangbao Li, Xiaoli Bian
The subharmonic Melnikov method for a class of planar piecewise-smooth systems ........................................................................................................ 283

Sebastian Lipa, Jerzy Mrozowski, Jan Awrejcewicz
Analysis of orbital strain and stress caused by multidirectional forces generated during a ball impact .......................................................... 295
Jakub Lorencki, Stanisław Radkowski
Switched Reluctance Motor (SRM) mechanical faults and their identification in frequency domain ................................................................. 305

Elif Cagda Kandemir Mazanoglu, Kemal Mazanoglu
Parametric study on implementation of viscous dampers for adjacent buildings ........................................................................................................ 313

Kemal Mazanoglu, Elif Cagda Kandemir Mazanoglu
Anti-symmetric mode in-plane vibration analyses of several types of frame structures ........................................................................................................ 323

Kemal Mazanoglu, Ali Ceylan
Rayleigh–Ritz natural frequency analyses for centrifugally stiffened functionally graded and tapered beams............................................................................. 333

Arkadiusz Mężyk, Wojciech Klein, Tomasz Czapla, Gabriel Mura
Numerical simulation of suspension system for autonomous tracked hybrid vehicle ........................................................................................................ 343

Jakub Młyńczak, Rafał Burdzik, Ireneusz Celiński
Research on vibrations in the train driver’s cab in the course of shunting activity ........................................................................................................ 353

Gabriel Mura, Marek Adamczyk, Michal Noconi
Numerical simulation of mobility of miners rescue robot .......................................................................................................................... 365

Milan Naď, Ladislav Rolník, Lenka Čičmancová
The effect of partially embedded inner reinforcing core on modal properties of the Euler-Bernoulli beam structures .......................................................... 377

Leonidas Paouris, Stephanos Theodossiades, Ramin Rahmani, Gregory Hunt
A hypoid gear pair tribo-dynamic model taking into account the rheological behavior of fully formulated gear lubricants .......................................................... 389

Wiktor Parandyk, Jan Awrejcewicz
Numerical analysis of the pressure oscillations in the human circulatory based on nonlinear hydro-mechanical system ......................................................... 407

Pavel Polach, Michal Hajžman, Miroslav Byrtus, Zbyněk Šíka
Influence of the fibre spring-damper computational models in a mechanical system on the coincidence with the experimental measurement results ........................................................................................................................................ 419

Jacek Przybylski, Krzysztof Kuliński
The influence of piezoelectric actuation on the lateral oscillation of a beam with varying cross section .............................................................................. 431

Jarosław Rusin
Vibrations of a double-string complex system subjected to uniformly distributed moving forces ........................................................................................................ 443
Sergii Skuratovskyi, Vjacheslav Danylenko
On the dynamics of solitary wave solutions supported by the model of mutually penetrating continua ................................................................................................................... 453

Alexandr Stefek, Vaclav Krivanek, Yves Bergeon, Jean Motsch
Simulation results of robot with differential drive moving on circular path ......................................................................................................................................... 461

Kamil Sybilski, Jerzy Małachowski
The influence of pretensioner characteristic of four-point fastening system on the disabled driver behavior during frontal crash .................................................... 471

Grażyna Sypniewska-Kamińska, Roman Starosta, Jan Awrejcewicz
Double pendulum colliding with a rough obstacle .......................................................................................................................... 483

Gabriel Szymkiewicz, Olga Szymanowska, Donat Lewandowski, Jan Awrejcewicz
Hydraulic unit of rotation into linear motion conversion – design, model, construction and testing ................................................................................................................. 493

Maciej Trojnacki, Przemysław Dąbek
Modelling and studies of dynamics of a wheeled mobile robot during longitudinal motion on the soft ground ............................................................................................................. 503

Peter Varkonyi
Dynamics of rigid bodies with multiple frictional contacts: new faces of Painleve’s paradox ............................................................................................................. 519

Vsevolod Vladimirov, Sergii Skuratovskyi
Solitary waves in one-dimensional pre-stressed lattice and its continual analog ................................................................................................................................. 531

Damian Walczak, Łukasz Zieliński, Krzysztof Szczurowski, Stanisław Radkowski
Proposed methods of controlling dual fuel CI engine using CAN-BUS information ......................................................................................................................... 543

Xiao Wang, Zhanming Qin
Nonlinear modal interactions in composite thin-walled beam structures with CAS lay-ups ......................................................................................................................... 555

Jin Wei, Dengqing Cao, Yang Yang, Wenhui Huang
Global modal approach for nonlinear dynamical modeling of an L-shaped beam-mass structure ......................................................................................................................... 567

Tomasz Węgrzyn, Jan Piwnik, Aleksander Borek, Wojciech Tarasiuk
Optimization of micro-jet dynamical systems cooling after steel welding ................................................................................................................................. 579

Adam Wijata, Jan Awrejcewicz, Jan Matej, Michał Makowski
Mathematical model for two-dimensional dry friction modified by dither ................................................................................................................................. 587
Wiktoria Wojnicz, Bartłomiej Zagrodny, Michał Ludwicki, Jan Awrejcewicz, Edmund Wittbrodt
Mathematical model of pennate muscle ............................................................ 595

Nikolai Yaroshevich, Ivan Zabrodets, Tetiana Yaroshevich
Dynamics of vibrating machines with unbalanced drive in case of flat vibrations of bearing body ................................................................. 609
